

L. F. Manufacturing, Inc.

Fiberglass Tanks, Manholes, Basins and Wetwells

LFM's fiberglass reinforced plastic or FRP tanks can be constructed to meet a variety of chemical, waste water, potable water or food grade applications. Each tank is engineered for the customer's specific application conditions. We can add cathodic protection, exterior UV inhibitors, fire retardants as well as nearly any color desired.

LFM's Oilfield tanks are known throughout the industry as competitively priced, available with short delivery lead times and delivered by our own fleet of experienced FRP tank handlers. FRP is particularly suited for connate or salt water storage.

LFM's FRP Manholes are also an excellent economic value. These fiberglass manholes are corrosion resistant to hydrogen sulfide gases (the nemesis of traditional concrete or spray on liners). They are light weight, strong and provide a long term solution to ground water infiltration or contamination. More and more Municipalities are considering both the installation and the long term maintenance advantages to FRP Manholes and requiring their use over concrete. LFM Wetwells, Basins and Lift Stations are all corrosion resistant as well and provide a safe economical solution to the environmental concerns and capacity limitations at the downstream processing plant caused by cracked and leaking concrete systems.
